1 Introduction

Linear logic is a well-known resource-sensitive logic. It has been used extensively to model attack trees. This paper concerns a non-commutative variant of linear logic and combines the non-commutative variant with Girard's linear logic [1]. We will only focus on the multiplicative (i.e. \otimes , \multimap) part of linear logic for simplicity. We construct the non-commutative variant by using a non-commutative tensor product \triangleright instead of the commutative \otimes , and two implications \leftarrow and \rightarrow for the two directions of \multimap .

We model the non-commutative linear logic categorically using an adjunction between a symmetric monoidal closed category and a Lambek category. Our categorial adjoint model has a similar structure as Benton's adjoint model [2], in which the multiplicative part of intuitionistic linear logic (ILL) is modeled using an adjunction between a cartesian closed category and a symmetric monoidal closed category. On the other hand, Moggi [3] uses monad models to map intuitionistic logic into ILL. As discussed in [4], Benton's adjoint models only gives rise to commutative monad models and the non-commutative part remained as an open problem. Therefore, by combining our adjoint models with Benton's, we would be able to get non-commutative monad models and thus non-commutative ILL.

The rest of the paper is organized as follows. Section 2 discusses existing approaches on constructing non-commutative linear logic. Section 3 contains the basic definitions in category theory that we will be using in our adjoint model. Familiar readers may skip this section. Section 4 contains the definition and essential properties of our adjoint model. Section 5 discusses the sequent calculus and natural deduction rules for our non-commutative linear logic. We prove that our sequent calculus has the property of cut-elimination and the natural deduction is strongly normalizing. Section 6 talks about the preliminary result after combining our non-commutative model with Benton's commutative model. Section 7 briefly mentions how our model could be used in attack trees and other areas. Section 8 concludes this paper with future work.

A , where Γ is a multiset of intuitionistic assumptions, Δ is a multiset of commutative linear assumptions, and Ω is a list of non-commutative linear assumptions. OLL contains logical connectives from all three the logics. Therefore, our non-commutative adjoint model is a part of OLL and after combining with Benton's commutative adjoint model, we would get a simplification of OLL.

Greco and Palmigiano [] also presents a variant of the multiplicative fragment of non-commutative ILL. But they focus on proper display calculi while we use sequent calculi.

3 Category Theory Basics

► **Definition 1.** A **monoidal category** $(\mathcal{M}, \triangleright, I, \alpha, \lambda, \rho)$ is a category \mathcal{M} consists of

- a bifunctor $\triangleright : \mathcal{M} \times \mathcal{M} \rightarrow \mathcal{M}$, called the tensor product;
- an object I , called the unit object;
- three natural isomorphisms α , λ , and ρ with components

$$\alpha_{A,B,C} : (A \triangleright B) \triangleright C \rightarrow A \triangleright (B \triangleright C)$$

$$\lambda_A : I \triangleright A \rightarrow A$$

$$\rho_A : A \triangleright I \rightarrow A$$

where α is called associator, λ is left unitor, and ρ is right unitor,

such that the following diagrams commute for any objects A, B, C in \mathcal{M} :

$$\begin{array}{ccc} ((A \triangleright B) \triangleright C) \triangleright D & \xrightarrow{\alpha_{A,B,C} \triangleright id_D} & (A \triangleright (B \triangleright C)) \triangleright D \xrightarrow{\alpha_{A,B \triangleright C, D}} A \triangleright ((B \triangleright C) \triangleright D) \\ \downarrow \alpha_{A \triangleright B, C, D} & & \downarrow id_A \triangleright \alpha_{B, C, D} \\ (A \triangleright B) \triangleright (C \triangleright D) & \xrightarrow{\alpha_{A, B, C \triangleright D}} & A \triangleright (B \triangleright (C \triangleright D)) \end{array}$$

$$\begin{array}{ccc} (A \triangleright I) \triangleright B & \xrightarrow{\alpha_{A, I, B}} & A \triangleright (I \triangleright B) \\ \downarrow \rho_A \triangleright id_B & & \downarrow id_A \triangleright \lambda_B \\ A \triangleright B & & A \triangleright B \end{array}$$

► **Definition 2.** A **Lambek category** (or a **biclosed monoidal category**) is a monoidal category $(\mathcal{M}, \triangleright, I, \alpha, \lambda, \rho)$ equipped with two bifunctors $\multimap : \mathcal{M}^{op} \times \mathcal{M} \rightarrow \mathcal{M}$ and $\leftarrow : \mathcal{M} \times \mathcal{M}^{op} \rightarrow \mathcal{M}$ that are both right adjoint to the tensor product. That is, the following natural bijections hold:

$$\text{Hom}_{\mathcal{L}}(X \triangleright A, B) \cong \text{Hom}_{\mathcal{L}}(X, A \multimap B)$$

$$\text{Hom}_{\mathcal{L}}(A \triangleright X, B) \cong \text{Hom}_{\mathcal{L}}(X, B \leftarrow A)$$

► **Definition 3.** A **symmetric monoidal category** (SMCC) is a monoidal category $(\mathcal{M}, \otimes, I, \alpha, \lambda, \rho)$ together with a natural transformation with components $\text{ex}_{A,B} : A \otimes B \rightarrow B \otimes A$, called **exchange**, such that the following diagrams commute:

$$\begin{array}{ccc} A \otimes I & \xrightarrow{\text{ex}_{A, I}} & I \otimes A \\ \downarrow \rho_A & & \downarrow \lambda_A \\ A & & A \end{array}$$

$$\begin{array}{ccc} A \otimes B & \xrightarrow{id_{A \otimes B}} & A \otimes B \\ \downarrow \text{ex}_{A, B} & & \downarrow \text{ex}_{B, A} \\ B \otimes A & & B \otimes A \end{array}$$

$$\begin{array}{ccccc} (A \otimes B) \otimes C & \xrightarrow{\alpha_{A, B, C}} & A \otimes (B \otimes C) & \xrightarrow{\text{ex}_{A, B \otimes C}} & (B \otimes C) \otimes A \\ \downarrow \text{ex}_{A, B} \otimes id_C & & & & \downarrow \alpha_{B, A, C} \\ (B \otimes A) \otimes C & \xrightarrow{\alpha_{B, A, C}} & B \otimes (A \otimes C) & \xrightarrow{id_B \otimes \text{ex}_{A, C}} & B \otimes (C \otimes A) \end{array}$$

We use \triangleright for non-symmetric monoidal categories while \otimes for symmetric ones.

► **Definition 4.** A **symmetric monoidal closed category** $(\mathcal{M}, \otimes, I, \alpha, \lambda, \rho)$ is a symmetric monoidal category equipped with a bifunctor $\multimap: \mathcal{M}^{op} \times \mathcal{M} \rightarrow \mathcal{M}$ that is right adjoint to the tensor product. That is, the following natural bijection $\text{Hom}_{\mathcal{M}}(X \otimes A, B) \cong \text{Hom}_{\mathcal{M}}(X, A \multimap B)$ holds.

► **Lemma 5.** Let A and B be two objects in a Lambek category with the exchange natural transformation. Then $(A \multimap B) \cong (B \multimap A)$.

Proof. First, notice that for any object C we have

$$\begin{aligned} \text{Hom}[C, A \multimap B] &\cong \text{Hom}[C \otimes A, B] && \mathcal{L} \text{ is a Lambek category} \\ &\cong \text{Hom}[A \otimes C, B] && \text{By the exchange } \text{ex}_{C,A} \\ &\cong \text{Hom}[C, B \multimap A] && \mathcal{L} \text{ is a Lambek category} \end{aligned}$$

Thus, $A \multimap B \cong B \multimap A$ by the Yoneda lemma. ◀

► **Corollary 6.** A Lambek category with exchange is symmetric monoidal closed.

► **Definition 7.** Let $(\mathcal{M}, \triangleright, I, \alpha, \lambda, \rho)$ and $(\mathcal{M}', \triangleright', I', \alpha', \lambda', \rho')$ be monoidal categories. A **monoidal functor** (F, m) from \mathcal{M} to \mathcal{M}' is a functor $F: \mathcal{M} \rightarrow \mathcal{M}'$ together with a morphism $m_I: I' \rightarrow F(I)$ and a natural transformation $m_{A,B}: FA \triangleright' FB \rightarrow F(A \triangleright B)$, such that the following diagrams commute for any objects A, B , and C in \mathcal{M} :

$$\begin{array}{ccccc} (FA \triangleright' FB) \triangleright' FC & \xrightarrow{\alpha'_{FA,FB,FC}} & FA \triangleright' (FB \triangleright' FC) & \xrightarrow{id_{FA} \triangleright' m_{A,B}} & FA \triangleright' F(B \triangleright C) \\ \downarrow m_{A,B} \triangleright' id_{FC} & & & & \downarrow m_{A,B \triangleright C} \\ F(A \triangleright B) \triangleright' FC & \xrightarrow{m_{A \triangleright B, C}} & F((A \triangleright B) \triangleright C) & \xrightarrow{F\alpha_{A,B,C}} & F(A \triangleright (B \triangleright C)) \end{array}$$

$$\begin{array}{ccc} I' \triangleright' FA & \xrightarrow{\lambda'_{FA}} & FA \\ \downarrow m_I \triangleright id_{FA} & & \uparrow F\lambda_A \\ FI \triangleright' FA & \xrightarrow{m_{I,A}} & F(I \triangleright A) \end{array} \quad \begin{array}{ccc} FA \triangleright' I' & \xrightarrow{\rho'_{FA}} & FA \\ \downarrow id_{FA} \triangleright m_I & & \uparrow F\rho_A \\ FA \triangleright' FI & \xrightarrow{m_{A,I}} & F(A \triangleright I) \end{array}$$

► **Definition 8.** Let $(\mathcal{M}, \otimes, I, \alpha, \lambda, \rho)$ and $(\mathcal{M}', \otimes', I', \alpha', \lambda', \rho')$ be symmetric monoidal categories. A **symmetric monoidal functor** $F: \mathcal{M} \rightarrow \mathcal{M}'$ is a monoidal functor (F, m) that satisfies the following coherence diagram:

$$\begin{array}{ccc} FA \otimes' FB & \xrightarrow{\text{ex}_{FA,FB}} & FB \otimes' FA \\ \downarrow m_{A,B} & & \downarrow m_{B,A} \\ F(A \otimes B) & \xrightarrow{F\text{ex}_{A,B}} & F(B \otimes A) \end{array}$$

► **Definition 9.** An **adjunction** between categories \mathcal{C} and \mathcal{D} consists of two functors $F: \mathcal{D} \rightarrow \mathcal{C}$, called the **left adjoint**, and $G: \mathcal{C} \rightarrow \mathcal{D}$, called the **right adjoint**, and two natural transformations $\eta: id_{\mathcal{D}} \rightarrow GF$, called the **unit**, and $\varepsilon: FG \rightarrow id_{\mathcal{C}}$, called the **counit**, such that the following diagrams commute for any object A in \mathcal{C} and B in \mathcal{D} :

$$\begin{array}{ccc} FB & \xrightarrow{F\eta_B} & FGFB \\ & \searrow \varepsilon_{FB} & \swarrow \\ & FB & \end{array} \quad \begin{array}{ccc} GA & \xrightarrow{\eta_{GA}} & GFGA \\ & \searrow G\varepsilon_A & \swarrow \\ & GA & \end{array}$$

► **Definition 10.** Let (F, m) and (G, n) be monoidal functors from a monoidal category $(\mathcal{M}, \otimes, I, \alpha, \lambda, \rho)$ to a monoidal category $(\mathcal{M}', \otimes', I', \alpha', \lambda', \rho')$. A **monoidal natural transformation** from (F, m) to (G, n) is a natural transformation $\theta : (F, m) \rightarrow (G, n)$ such that the following diagrams commute for any objects A and B in \mathcal{M} :

$$\begin{array}{ccc} FA \triangleright' FB & \xrightarrow{m_{A,B}} & F(A \triangleright B) \\ \theta_A \triangleright' \theta_B \downarrow & & \downarrow \theta_{A \triangleright B} \\ GA \triangleright' GB & \xrightarrow{n_{A,B}} & G(A \triangleright B) \end{array} \quad \begin{array}{ccc} FI & \xrightarrow{\theta_I} & GI \\ m_I \swarrow & & \searrow n_I \\ & I' & \end{array}$$

► **Definition 11.** Let $(\mathcal{M}, \triangleright, I, \alpha, \lambda, \rho)$ and $(\mathcal{M}', \triangleright', I', \alpha', \lambda', \rho')$ be monoidal categories, $F : \mathcal{M} \rightarrow \mathcal{M}'$ and $G : \mathcal{M}' \rightarrow \mathcal{M}$ be functors. The adjunction $F : \mathcal{M} \dashv \mathcal{M}' : G$ is a **monoidal adjunction** if F and G are monoidal functors, and the unit η and the counit ε are monoidal natural transformations.

► **Definition 12.** Let C be a category. A **monad** on C consists of an endofunctor $T : C \rightarrow C$ together with two natural transformations $\eta : id_C \rightarrow T$ and $\mu : T^2 \rightarrow T$, where id_C is the identity functor on C , such that the following diagrams commute:

$$\begin{array}{ccc} T^3 & \xrightarrow{T\mu} & T^2 \\ \mu_T \downarrow & & \downarrow \mu \\ T^2 & \xrightarrow{\mu} & T \end{array} \quad \begin{array}{ccc} T & \xrightarrow{\eta_T} & T^2 \\ T\eta \downarrow & \searrow & \downarrow \mu \\ T^2 & \xrightarrow{\mu} & T \end{array}$$

► **Definition 13.** Let $(\mathcal{M}, \triangleright, I, \alpha, \lambda, \rho)$ be a monoidal category and (T, η, μ) be a monad on \mathcal{M} . T is a **strong monad** if there is natural transformation τ , called the **tensorial strength**, with components $\tau_{A,B} : A \triangleright TB \rightarrow T(A \triangleright B)$ such that the following diagrams commute:

$$\begin{array}{ccc} I \triangleright TA & \xrightarrow{\tau_{I,A}} & T(I \triangleright A) \\ \lambda_{TA} \searrow & & \swarrow T\lambda_A \\ & TA & \end{array} \quad \begin{array}{ccc} A \triangleright B & \xrightarrow{id_A \triangleright \eta_B} & A \triangleright TB \\ \eta_{A \triangleright B} \searrow & & \swarrow \tau_{A,B} \\ & T(A \triangleright B) & \end{array}$$

$$\begin{array}{ccc} (A \triangleright B) \triangleright TC & \xrightarrow{\tau_{A \triangleright B, C}} & T((A \triangleright B) \triangleright C) \\ \alpha_{A,B,TC} \downarrow & & \downarrow T\alpha_{A,B,C} \\ A \triangleright (B \triangleright TC) & \xrightarrow{id_A \triangleright \tau_{B,C}} A \triangleright T(B \triangleright C) \xrightarrow{\tau_{A, B \triangleright C}} & T(A \triangleright (B \triangleright C)) \end{array}$$

$$\begin{array}{ccccc} A \triangleright T^2 B & \xrightarrow{\tau_{A, TB}} & T(A \triangleright TB) & \xrightarrow{T\tau_{A,B}} & T^2(A \triangleright B) \\ id_A \triangleright \mu_B \downarrow & & & & \downarrow \mu_{A \triangleright B} \\ A \triangleright TB & \xrightarrow{\tau_{A,B}} & T(A \triangleright B) & & \end{array}$$

► **Definition 14.** Let $(\mathcal{M}, \otimes, I, \alpha, \lambda, \rho)$ be a symmetric monoidal category with exchange ex , and (T, η, μ) be a strong monad on \mathcal{M} . Then there is a “**twisted**” tensorial strength $\tau'_{A,B} : TA \otimes B \rightarrow T(A \otimes B)$ defined as $\tau'_{A,B} = Tex \circ \tau_{B,A} \circ ex$. We can construct a pair of natural transformations Φ, Φ' with components $\Phi_{A,B}, \Phi'_{A,B} : TA \otimes TB \rightarrow T(A \otimes B)$ defined as $\Phi_{A,B} = \mu_{A \otimes B} \circ T\tau'_{A,B} \circ \tau_{TA,B}$ and $\Phi'_{A,B} = \mu_{A \otimes B} \circ T\tau_{A,B} \circ \tau'_{A,TB}$. If $\Phi = \Phi'$, then the monad T is **commutative**.

► **Definition 15.** Let \mathcal{L} be a category. A **comonad** on \mathcal{L} consists of an endofunctor $S : \mathcal{L} \rightarrow \mathcal{L}$ together with two natural transformations $\varepsilon : S \rightarrow id_{\mathcal{L}}$ and $\delta : S^2 \rightarrow S$ such that the following diagrams commute:

$$\begin{array}{ccc} S & \xrightarrow{\delta} & S^2 \\ \delta \downarrow & & \downarrow S\delta \\ S^2 & \xrightarrow{\delta_S} & S^3 \end{array} \quad \begin{array}{ccc} S^2 & \xrightarrow{S\varepsilon} & S \\ \varepsilon_S \downarrow & & \downarrow \delta \\ S & \xrightarrow{\delta} & S^2 \end{array}$$

4 An Adjoint Model

Our adjoint model, SMCC-Lambek model, has a similar structure as Benton's LNL model []. Benton's LNL model consists of a symmetric monoidal adjunction $F : \mathcal{C} \dashv \mathcal{L} : G$ between a cartesian closed category \mathcal{C} and a symmetric monoidal closed category \mathcal{L} .

► **Definition 16.** A **SMCC-Lambek model** consists of

- a symmetric monoidal closed category $(\mathcal{C}, \otimes, I, \alpha, \lambda, \rho)$;
- a Lambek category $(\mathcal{L}, \triangleright, I', \alpha', \lambda', \rho')$;
- a monoidal adjunction $F : \mathcal{C} \dashv \mathcal{L} : G$, where $F : \mathcal{C} \rightarrow \mathcal{L}$ and $G : \mathcal{L} \rightarrow \mathcal{C}$ are monoidal functors.

Thus, in a SMCC-Lambek model, the following four diagrams commute because η and ε are monoidal natural transformations:

$$\begin{array}{ccc} X \otimes Y & \xrightarrow{id_{X \otimes Y}} & X \otimes Y \\ \eta_X \otimes \eta_Y \downarrow & & \downarrow \eta_{X \otimes Y} \\ GFX \otimes GFY & \xrightarrow{\eta_{FX, FY}} G(FX \otimes FY) \xrightarrow{Gm_{X, Y}} & GF(X \otimes Y) \end{array} \quad \begin{array}{ccc} I & \xrightarrow{\eta_I} & GF I \\ \parallel & & \uparrow Gm_I \\ I & \xrightarrow{\eta_{I'}} & GI' \end{array}$$

$$\begin{array}{ccc} FGA \otimes FGB & \xrightarrow{m_{GA, GB}} F(GA \otimes GB) \xrightarrow{F\eta_{A, B}} & FG(A \otimes B) \\ \varepsilon_A \otimes \varepsilon_B \downarrow & & \downarrow \varepsilon_{A \otimes B} \\ A \otimes B & \xrightarrow{id_{A \otimes B}} & A \otimes B \end{array} \quad \begin{array}{ccc} FGI' & \xrightarrow{\varepsilon_{I'}} & I' \\ F\eta_{I'} \uparrow & & \parallel \\ FI & \xleftarrow{m_I} & I' \end{array}$$

And the following two diagrams commute because of the adjunction:

$$\begin{array}{ccc} FX & \xrightarrow{F\eta_X} & FGFX \\ \parallel & & \searrow \varepsilon_{FX} \\ & & FX \end{array} \quad \begin{array}{ccc} GA & \xrightarrow{\eta_{GA}} & GFGA \\ \parallel & & \searrow G\varepsilon_A \\ & & GA \end{array}$$

Following the tradition, we use letters X, Y, Z for objects in \mathcal{C} and A, B, C for objects in \mathcal{L} . The following lemmas and theorems establish the essential properties of the monad and the comonad derived from the adjunction.

► **Lemma 17.** *The monad on the symmetric monoidal closed category \mathcal{C} in a SMCC-Lambek model is monoidal.*

Proof. We define the monad T on the \mathcal{C} in the adjunction of a SMCC-Lambek model as $T = GF$, and the two corresponding natural transformations $\eta : id_{\mathcal{C}} \rightarrow T$ and $\mu : T^2 \rightarrow T$ as

$$\eta_X : X \rightarrow GFX \quad \mu_X = G\varepsilon_{FX} : GFGFX \rightarrow GFX$$

where η is the unit and $\varepsilon : FG \rightarrow id_{\mathcal{L}}$ is the counit of the adjunction $F : \mathcal{C} \dashv \mathcal{L} : G$. Since the adjunction is monoidal, then (F, m) and (G, n) are monoidal functors. Thus, we have

$$t_{X,Y} = Gm_{X,Y} \circ n_{FX,FY} : TX \otimes TY \rightarrow T(X \otimes Y)$$

$$t_I = Gm_I \circ n_I : I \rightarrow TI$$

The monad T being monoidal means

1. T is a monoidal functor, i.e. the following diagrams commute:

$$\begin{array}{ccc}
 (TX \otimes TY) \otimes TZ & \xrightarrow{\alpha_{TX,TY,TZ}} & TX \otimes (TY \otimes TZ) \xrightarrow{id_{TX} \otimes t_{YZ}} TX \otimes T(Y \otimes Z) \\
 \downarrow t_{X,Y} \otimes id_{TZ} & & \downarrow t_{X,Y \otimes Z} \\
 T(X \otimes Y) \otimes TZ & \xrightarrow{t_{X \otimes Y, Z}} & T((X \otimes Y) \otimes Z) \xrightarrow{T\alpha_{X,Y,Z}} T(X \otimes (Y \otimes Z))
 \end{array} \quad (1)$$

$$\begin{array}{ccc}
 I \otimes TX & \xrightarrow{\lambda_{TX}} & TX \\
 \downarrow t_I \otimes id_{TX} & & \uparrow T\lambda_X \\
 TI \otimes TX & \xrightarrow{t_{I,X}} & T(I \otimes X)
 \end{array} \quad (2)$$

$$\begin{array}{ccc}
 TX \otimes I & \xrightarrow{\rho_{TX}} & TX \\
 \downarrow id_{TX} \otimes t_I & & \uparrow T\rho_X \\
 TX \otimes TI & \xrightarrow{t_{X,I}} & T(X \otimes I)
 \end{array} \quad (3)$$

We write GF instead of T in the proof for clarity.

By replacing $t_{X,Y}$ with its definition, diagram (1) above commutes by the following commutative diagram, in which the two hexagons commute because G and F are monoidal functors, and the two quadrilaterals commute by the naturality of n .

$$\begin{array}{ccccc}
 (GF \otimes GF) \otimes GF & \xrightarrow{\alpha_{GF,GF,GF}} & GF \otimes (GF \otimes GF) & \xrightarrow{id_{GF} \otimes n_{F,F}} & GF \otimes G(F \otimes F) \\
 \downarrow n_{F,F} \otimes id_{GF} & & \downarrow n_{F,F} \otimes n_{F,F} & & \downarrow id_{GF} \otimes Gm_{F,F} \\
 G(F \otimes F) \otimes GF & & G(F \otimes (F \otimes F)) & & GF \otimes GF(F \otimes F) \\
 \downarrow Gm_{F,F} \otimes id_{GF} & \searrow n_{F,F} \otimes n_{F,F} & \downarrow G\alpha'_{F,F,F} & \swarrow G(id_F \otimes m_{F,F}) & \downarrow n_{F,F} \otimes n_{F,F} \\
 GF(F \otimes F) \otimes GF & & G((F \otimes F) \otimes F) & & GF(F \otimes F) \otimes GF \\
 \downarrow n_{F(F \otimes F), F} & \swarrow G(m_{F,F} \otimes id_F) & \downarrow G(m_F \otimes id_F) & & \downarrow Gm_{F,F} \\
 GF(F \otimes F) \otimes GF & \xrightarrow{Gm_{F,F} \otimes id_F} & GF((F \otimes F) \otimes F) & \xrightarrow{GF\alpha_{F,F,F}} & GF(F \otimes (F \otimes F))
 \end{array}$$

Diagram (2) commutes by the following commutative diagrams, in which the top quadrilateral commutes because G is monoidal, the right quadrilateral commutes because F is monoidal, and the left square commutes by the naturality of n .

$$\begin{array}{ccc}
 I \otimes GF & \xrightarrow{\lambda_{GF}} & GF \\
 \downarrow n_I \otimes id_{GF} & & \downarrow G\lambda'_F \\
 G(I) \otimes GF & \xrightarrow{n_{I,GF}} & G(I \otimes F) \\
 \downarrow Gm_I \otimes id_{GF} & \downarrow G(m_I \otimes id_F) & \downarrow Gm_{I,F} \\
 GF(I) \otimes GF & \xrightarrow{n_{FI,GF}} & GF(FI \otimes F) \xrightarrow{Gm_{FI,F}} GF(I \otimes X)
 \end{array}$$

Similarly, diagram (3) commutes as follows:

$$\begin{array}{ccc}
 GFX \otimes I & \xrightarrow{\rho_{GFX}} & GFX \\
 \downarrow id_{GFX} \otimes \eta_{I'} & & \uparrow GF \rho_X \\
 GFX \otimes GI' & \xrightarrow{\eta_{FX, I'}} & G(FX \triangleright I') \\
 \downarrow id_{GFX} \otimes Gm_I & & \uparrow G(id_{FX} \otimes m_I) \\
 GFX \otimes GF I & \xrightarrow{\eta_{FX, FI}} & G(FX \triangleright FI) \xrightarrow{Gm_{X, I}} GF(X \otimes I)
 \end{array}$$

2. η is a monoidal natural transformation. In fact, since η is the unit of the monoidal adjunction, η is monoidal by definition and thus the following two diagrams commute.

$$\begin{array}{ccc}
 X \otimes Y & \xlongequal{\quad} & X \otimes Y \\
 \downarrow \eta_X \otimes \eta_Y & & \downarrow \eta_{X \otimes Y} \\
 TX \otimes TY & \xrightarrow{t_{X, Y}} & T(X \otimes Y)
 \end{array}
 \quad
 \begin{array}{ccc}
 I & \xrightarrow{\eta_I} & TI \\
 \parallel & & \uparrow t_I \\
 I & & I
 \end{array}$$

3. μ is a monoidal natural transformation. It is obvious that since $\mu = G\varepsilon_{FA}$ and ε is monoidal, so is μ . Thus the following diagrams commute.

$$\begin{array}{ccc}
 T^2X \otimes T^2Y & \xrightarrow{t_{TX, TY}} & T(TX \otimes TY) \xrightarrow{Tt_{X, Y}} T^2(X \otimes Y) \\
 \downarrow \mu_X \otimes \mu_Y & & \downarrow \mu_{X \otimes Y} \\
 TX \otimes TY & \xrightarrow{t_{X, Y}} & T(X \otimes Y)
 \end{array}
 \quad
 \begin{array}{ccc}
 T^2I & \xrightarrow{\mu_I} & TI \\
 \uparrow Tt_I & & \uparrow t_I \\
 TI & \xleftarrow{t_I} & I
 \end{array}$$

However, the monad is not symmetric because the following diagram does not commute, for the lambek category \mathcal{L} is not symmetric.

$$\begin{array}{ccccc}
 GFX \otimes GFY & \xrightarrow{\Theta_{GFX, GFY}} & GFY \otimes GFX & \xrightarrow{\eta_{FY, FX}} & G(FY \triangleright FX) \\
 \downarrow \eta_{FX, FY} & & & & \downarrow Gm_{Y, X} \\
 G(FX \triangleright FY) & \xrightarrow{Gm_{X, Y}} & GF(X \otimes Y) & \xrightarrow{GF\Theta_{X, Y}} & GF(Y \otimes X)
 \end{array}$$

► **Lemma 18.** *The monad on the symmetric monoidal closed category in a SMCC-Lambek model is strong.*

Proof. Let $F : C \vdash \mathcal{L} : G$ be a SMCC-Lambek model, where $(C, \otimes, I, \alpha, \lambda, \rho)$ is symmetric monoidal closed, $(\mathcal{L}, \triangleright, I', \alpha', \lambda', \rho')$ is a Lambek category, and (F, m) and (G, n) are monoidal functors. We have proved that the monad $(T = GF, \eta, \mu)$ is monoidal with the natural transformation $t_{X, Y} : TX \otimes TY \rightarrow T(X \otimes Y)$ and the morphism $t_I : I \rightarrow TI$ defined as in Lemma 17.

We define the tensorial strength $\tau_{X, Y} : X \otimes TY \rightarrow T(X \otimes Y)$ as $\tau_{X, Y} = t_{X, Y} \circ (\eta_X \otimes id_{TY})$.

Since η is a monoidal natural transformation, we have $\eta_I = Gm_I \circ \eta_{I'}$. Therefore $\eta_I = t_I$. Thus the following diagram commutes because T is monoidal, where the composition $t_{I, X} \circ (t_I \otimes id_{TX})$ is the definition of $\tau_{I, X}$. So the first triangle in Definition 13 commutes.

$$\begin{array}{ccc}
 I \otimes TX & \xrightarrow{t_I \otimes id_{TX}} & TI \otimes TX \\
 \downarrow \lambda_{TX} & & \downarrow t_{I, X} \\
 TX & \xleftarrow{T\lambda_X} & T(I \otimes X)
 \end{array}$$

Similarly, by using the definition of τ , the the second triangle in the definition is equivalent to the following diagram, which commutes because η is a monoidal natural transformation:

$$\begin{array}{ccc}
 X \otimes Y & \xrightarrow{id_X \otimes \eta_Y} & X \otimes TY \\
 \eta_{X \otimes Y} \downarrow & \searrow \eta_X \otimes \eta_Y & \downarrow \eta_X \otimes id_{TY} \\
 T(X \otimes Y) & \xleftarrow{t_{X,Y}} & TX \otimes TY
 \end{array}$$

The first pentagon in the definition commutes by the following commutative diagrams, because η are α natural transformations and T is monoidal:

$$\begin{array}{ccccc}
 (X \otimes Y) \otimes TZ & \xrightarrow{\eta_{X \otimes Y} \otimes id_{TZ}} & T(X \otimes Y) \otimes TZ & \xrightarrow{t_{X \otimes Y, Z}} & T((X \otimes Y) \otimes Z) \\
 \alpha_{X,Y,TZ} \downarrow & \searrow (\eta_X \otimes \eta_Y) \otimes id_{TZ} & \uparrow t_{X,Y} \otimes id_{TZ} & & \downarrow T\alpha_{X,Y,Z} \\
 X \otimes (Y \otimes TZ) & & (TX \otimes TY) \otimes TZ & & T(X \otimes (Y \otimes Z)) \\
 \eta_X \otimes (\eta_Y \otimes id_{TZ}) \searrow & & \downarrow \alpha_{TX,TY,TZ} & & \uparrow t_{X,Y \otimes Z} \\
 id_X \otimes (\eta_Y \otimes id_{TZ}) \downarrow & & TX \otimes (TY \otimes TZ) & & \\
 X \otimes (TY \otimes TZ) & \xrightarrow{id_X \otimes t_{Y,Z}} & X \otimes T(Y \otimes Z) & \xrightarrow{\eta_X \otimes id_{T(Y \otimes Z)}} & TX \otimes T(Y \otimes Z)
 \end{array}$$

The last diagram in the definition commutes by the following commutative diagram, because T is a monad, t is a natural transformation, and μ is a monoidal natural transformation:

$$\begin{array}{ccccc}
 X \otimes T^2 Y & \xrightarrow{\eta_X \otimes id_{T^2 Y}} & TX \otimes T^2 Y & \xrightarrow{t_{X, TY}} & T(X \otimes TY) \\
 id_X \otimes \mu_Y \downarrow & & \parallel & & \downarrow T(\eta_X \otimes id_{TY}) \\
 X \otimes TY & \xrightarrow{id_{TX} \otimes \mu_Y} & TX \otimes T^2 Y & \xleftarrow{\mu_X \otimes id_{T^2 Y}} & T^2 X \otimes T^2 Y \xrightarrow{t_{TX, TY}} T(TX \otimes TY) \\
 \eta_X \otimes id_{TY} \downarrow & \swarrow id_{TX} \otimes \mu_Y & \swarrow \mu_X \otimes \mu_Y & & \downarrow T t_{X,Y} \\
 TX \otimes TY & \xrightarrow{t_{X,Y}} & T(X \otimes Y) & \xleftarrow{\mu_{X \otimes Y}} & T^2(X \otimes Y)
 \end{array}$$

► **Lemma 19** ([?]). *Let \mathcal{M} be a symmetric monoidal category and T be a strong monad on \mathcal{M} . Then T is symmetric iff it is commutative.*

► **Theorem 20.** *The monad on the SMCC in a SMCC-Lambek model is monoidal and non-commutative.*

► **Lemma 21.** *The comonad on the Lambek category in a SMCC-Lambek model is monoidal.*

Proof. We define the comonad S on the Lambek category \mathcal{L} in the adjunction $F : \mathcal{C} \vdash \mathcal{L} : G$ of a SMCC-Lambek model as $S = FG$. The two corresponding natural transformations $\varepsilon : S \rightarrow id_{\mathcal{L}}$ and $\delta : S \rightarrow S^2$ are defined as

$$\varepsilon_A : SA \rightarrow A \quad \delta_A = F\eta_{GA} : SA \rightarrow S^2 A$$

where ε is the counit and $\eta : id_{\mathcal{L}} \rightarrow GF$ is the unit of the adjunction, and (F, m) and (G, n) are monoidal functors. Thus, we have

$$s_{A,B} = F n_{A,B} \circ m_{GA,GB} : SA \triangleright SB \rightarrow SA \triangleright SB \quad s_I = F n_{I'} \circ m_I : I' \rightarrow S I'$$

The comonad S being monoidal means

1. S is a monoidal functor, i.e. the following diagrams commute:

$$\begin{array}{ccccc}
 (SA \triangleright SB) \triangleright SC & \xrightarrow{\alpha'_{SA,SB,SC}} & SA \triangleright (SB \triangleright SC) & \xrightarrow{id_{SA} \triangleright s_{B,C}} & SA \triangleright S(B \triangleright C) \\
 \downarrow s_{A,B} \triangleright id_{SC} & & & & \downarrow s_{A,B \triangleright C} \\
 S(A \triangleright B) \triangleright SC & \xrightarrow{s_{A \triangleright B, C}} & S((A \triangleright B) \triangleright C) & \xrightarrow{S\alpha'_{A,B,C}} & S(A \triangleright (B \triangleright C))
 \end{array}$$

$$\begin{array}{ccc}
 I' \triangleright SA & \xrightarrow{\lambda'_{SA}} & SA \\
 \downarrow s_{I'} \triangleright id_{SA} & & \uparrow S\lambda'_A \\
 SI' \triangleright SA & \xrightarrow{s_{I',A}} & S(I' \triangleright A)
 \end{array}$$

$$\begin{array}{ccc}
 SA \triangleright I' & \xrightarrow{\rho'_{SA}} & SA \\
 \downarrow id'_{SA} \triangleright s_{I'} & & \uparrow S\rho'_A \\
 SA \triangleright SI' & \xrightarrow{s_{A,I'}} & S(A \triangleright I')
 \end{array}$$

2. ε is a monoidal natural transformation:

$$\begin{array}{ccc}
 SA \triangleright SB & \xrightarrow{s_{A,B}} & S(A \triangleright B) \\
 \downarrow \varepsilon_A \triangleright \varepsilon_B & & \downarrow \varepsilon_{A \triangleright B} \\
 A \triangleright B & \xlongequal{\quad} & A \triangleright B
 \end{array}$$

$$\begin{array}{ccc}
 SI' & \xrightarrow{\varepsilon_{I'}} & I' \\
 \swarrow s_{I'} & & \nearrow \\
 & I' &
 \end{array}$$

3. δ is a monoidal natural transformation:

$$\begin{array}{ccc}
 SA \triangleright SA & \xrightarrow{s_{A,B}} & S(A \triangleright B) \\
 \downarrow \delta_A \triangleright \delta_B & & \downarrow \delta_{A \triangleright B} \\
 S^2A \triangleright S^2B & \xrightarrow{s_{S^2A, S^2B}} & S(SA \triangleright SB) \xrightarrow{Ss_{A,B}} S^2(A \triangleright B)
 \end{array}$$

$$\begin{array}{ccc}
 SI' & \xrightarrow{\delta_{I'}} & S^2I' \\
 \uparrow s_{I'} & & \uparrow Ss_{I'} \\
 I' & \xrightarrow{s_{I'}} & SI'
 \end{array}$$

The proof for the commutativity of the diagrams are similar as the proof in Lemma 17. We do not include the proof here for simplicity. \blacktriangleleft

The comonad S on the Lambek category \mathcal{L} of the adjunction is clearly not symmetric because \mathcal{L} is not. However, it is symmetric on the co-Eilenberg-Moore category of the comonad.

► **Definition 22.** Let (S, ε, δ) be a comonad on a category \mathcal{L} . Then the **co-Eilenberg-Moore category** \mathcal{L}^S of the comonad has

- as objects the S -coalgebras $(A, h_A : A \rightarrow SA)$, where A is an object in \mathcal{L} , s.t. the following diagrams commute:

$$\begin{array}{ccc}
 A & \xrightarrow{h_A} & SA \\
 h_A \downarrow & & \downarrow \delta_A \\
 SA & \xrightarrow{Sh_A} & S^2A
 \end{array}$$

$$\begin{array}{ccc}
 & SA & \\
 h_A \nearrow & & \searrow \varepsilon_A \\
 A & \xlongequal{\quad} & A
 \end{array}$$

- as morphisms the coalgebra morphisms, i.e. morphisms $f : (A, h_A) \rightarrow (B, h_B)$ between coalgebras s.t. the diagram commutes:

$$\begin{array}{ccc}
 A & \xrightarrow{f} & B \\
 h_A \downarrow & & \downarrow h_B \\
 SA & \xrightarrow{Sf} & SB
 \end{array}$$

► **Lemma 23.** Given a SMCC-Lambek model $F : C \dashv \mathcal{L} : G$ and the comonad S on \mathcal{L} , the co-Eilenberg-Moore category \mathcal{L}^S of has an exchange natural transformation $\text{ex}_{A,B}^S : A \triangleright B \rightarrow B \triangleright A$.

Proof. We define the exchange $\text{ex}_{A,B}^S : A \triangleright B \rightarrow B \triangleright A$ as

$$A \triangleright B \xrightarrow{h_A \triangleright h_B} FGA \triangleright FGB \xrightarrow{m_{GA,GB}} F(GA \otimes GB) \xrightarrow{F\text{ex}_{GA,GB}} F(GB \otimes GA) \xrightarrow{F\eta_{B,A}} FG(B \triangleright A) \xrightarrow{\varepsilon_{B \triangleright A}} B \triangleright A$$

in which (F, m) and (G, n) are monoidal functors, and ex is the exchange for C . ex^S is a natural transformation because the following diagrams commute for morphisms $f : A \rightarrow A'$ and $g : B \rightarrow B'$:

$$\begin{array}{ccccccccccc} A \triangleright B & \xrightarrow{h_A \triangleright h_B} & FGA \triangleright FGB & \xrightarrow{m_{GA,GB}} & F(GA \otimes GB) & \xrightarrow{F\text{ex}_{GA,GB}} & F(GB \otimes GA) & \xrightarrow{F\eta_{B,A}} & FG(B \triangleright A) & \xrightarrow{\varepsilon_{B \triangleright A}} & B \triangleright A \\ f \triangleright g \downarrow & & \downarrow FGf \triangleright FGg & & \downarrow F(Gf \otimes Gg) & & \downarrow F(Gg \otimes Gf) & & \downarrow FG(g \triangleright f) & & \downarrow g \triangleright f \\ A' \triangleright B' & \xrightarrow{h_{A'} \triangleright h_{B'}} & FGA' \triangleright FGB' & \xrightarrow{m_{GA',GB'}} & F(GA' \otimes GB') & \xrightarrow{F\text{ex}_{A',B'}} & F(GB' \otimes GA') & \xrightarrow{F\eta_{B',A'}} & FG(B' \triangleright A') & \xrightarrow{\varepsilon_{B' \triangleright A'}} & B' \triangleright A' \end{array}$$

◀

► **Lemma 24.** The following diagrams commute in the co-Eilenberg-Moore category \mathcal{L}^S :

$$\begin{array}{ccccc} F((GA \otimes GB) \otimes GC) & \xrightarrow{F(\eta_{A,B} \otimes id_{GC})} & F(G(A \triangleright B) \otimes GC) & \xrightarrow{F(\text{ex}_{A,B} \otimes id_{GC})} & FG((A \triangleright B) \triangleright C) \\ \downarrow F(\text{ex}_{A,B} \otimes id_{GC}) & & & & \downarrow \varepsilon_{(A \triangleright B) \triangleright C} \\ F(G(B \triangleright A) \otimes GC) & & & & (A \triangleright B) \triangleright C \\ \downarrow F(\eta_{B,A} \otimes id_{GC}) & & & & \downarrow \text{ex}_{A,B}^S \triangleright id_C \\ F(G(B \triangleright A) \otimes GC) & \xrightarrow{F\eta_{B \triangleright A, C}} & FG((B \triangleright A) \triangleright C) & \xrightarrow{\varepsilon_{(B \triangleright A) \triangleright C}} & (B \triangleright A) \triangleright C \end{array}$$

$$\begin{array}{ccccc} F(GB \otimes (GC \otimes GA)) & \xrightarrow{F(id_{GB} \otimes \eta_{C,A})} & F(GB \otimes G(C \triangleright A)) & \xrightarrow{F\eta_{B, C \triangleright A}} & FG(B \triangleright (C \triangleright A)) \\ \downarrow F(id_{GB} \otimes \text{ex}_{C,A}) & & & & \downarrow \varepsilon_{B \triangleright (C \triangleright A)} \\ F(GB \otimes (GA \otimes GC)) & & & & B \triangleright (C \triangleright A) \\ \downarrow F(id_{GB} \otimes \eta_{A,C}) & & & & \downarrow id_A \triangleright \text{ex}_{C,A}^S \\ F(GB \otimes G(A \triangleright C)) & \xrightarrow{F\eta_{B, A \triangleright C}} & FG(B \triangleright (A \triangleright C)) & \xrightarrow{\varepsilon_{B \triangleright (A \triangleright C)}} & B \triangleright (A \triangleright C) \end{array}$$

Proof. We only write the proof for the first diagram. The proof for the second one is similar. (1), (2), (3)–naturality of m ; (4)– F is monoidal; (5), (12)– ε is monoidal; (6), (7), (8), (9), (10)–obvious;

(11)–coalgebra.

$$\begin{array}{c}
 \begin{array}{ccccc}
 F(G(A \triangleright B) \otimes GC) & \xrightarrow{F\eta_{A \triangleright B, C}} & FG((A \triangleright B) \triangleright C) & \xrightarrow{\varepsilon_{(A \triangleright B) \triangleright C}} & (A \triangleright B) \triangleright C \\
 \uparrow F(\eta_{A, B} \otimes id_{GC}) & \nwarrow m_{G(A \triangleright B), GC} & \uparrow \varepsilon_{A \triangleright B \triangleright C} & \nwarrow \varepsilon_{A \triangleright B \triangleright id_C} & \nwarrow (\varepsilon_A \triangleright \varepsilon_B) \triangleright id_C \\
 & (5) & & & (11) \\
 F((GA \otimes GB) \otimes GC) & \xrightarrow{(1)} & FG(A \triangleright B) \triangleright FGC & \xrightarrow{id \triangleright \varepsilon_C} & FG(A \triangleright B) \triangleright C \\

 & (1) & & & (12) \\
 F((GB \otimes GA) \otimes GC) & \xrightarrow{(2)} & FG(A \otimes GB) \triangleright FGC & \xrightarrow{id_{F(GA \otimes GB)} \triangleright \varepsilon_C} & F(GA \otimes GB) \triangleright C \\
 \uparrow F(\eta_{A, B} \otimes id_{GC}) & \nwarrow m_{GB \otimes GA, GC} & \uparrow F\eta_{A, B} \triangleright id_{FGC} & \nwarrow F\eta_{A, B} \otimes id_C & \nwarrow m_{GA, GB} \triangleright id_C \\
 & (2) & & & (8) \\
 F(G(B \triangleright A) \otimes GC) & \xrightarrow{(3)} & FG(B \triangleright A) \triangleright FGC & \xrightarrow{id \triangleright \varepsilon_C} & FG(B \triangleright A) \triangleright C \\
 \uparrow F(\eta_{B, A} \otimes id_{GC}) & \nwarrow m_{G(B \triangleright A), GC} & \uparrow F\eta_{B, A} \triangleright id_{FGC} & \nwarrow F\eta_{B, A} \otimes id_C & \nwarrow m_{GA, GB} \triangleright id_C \\
 & (3) & & & (10) \\
 FG((B \triangleright A) \triangleright C) & \xrightarrow{(4)} & (B \triangleright A) \triangleright C & \xrightarrow{\varepsilon_{B \triangleright A} \triangleright id_C} & FG(B \triangleright A) \triangleright C \\
 \uparrow F\eta_{B \triangleright A, C} & \nwarrow \varepsilon_{(B \triangleright A) \triangleright C} & \uparrow \varepsilon_{B \triangleright A} \triangleright \varepsilon_C & \nwarrow id_{FG(B \triangleright A)} \triangleright \varepsilon_C & \nwarrow F\eta_{B \triangleright A} \triangleright id_C \\
 & (4) & & & (9)
 \end{array}
 \end{array}$$

► **Theorem 25.** *The co-Eilenberg-Moore category \mathcal{L}^S of S is symmetric monoidal closed.*

Proof. Let $(\mathcal{L}, \triangleright, I', \alpha', \lambda', \rho')$ be the Lambek category in a SMCC-Lambek model and S be the comonad on \mathcal{L} . Since \mathcal{L} is a Lambek category, it is obvious that \mathcal{L} is also Lambek. By Corollary 6, we only need to prove the exchange defined in Lemma 23 satisfies the three commutative diagrams in Definition 3.

The first triangle in Definition 3 commutes as follows: (1)–coalgebra; (2)– ε is monoidal; (3)–naturality of ρ ; (4)–naturality of ε ; (5)–naturality of m ; (6)– F is monoidal; (7)– C is symmetric; (8)–naturality of ex ; (9)– G is monoidal.

$$\begin{array}{ccccc}
 A \triangleright I' & \xrightarrow{h_A \triangleright h_{I'}} & FGA \triangleright FGI' & \xrightarrow{m_{GA, GI'}} & F(GA \otimes GI') \\
 \downarrow \rho'_A & \swarrow \varepsilon_{FGA \triangleright I'} & \downarrow id_{FGA} \triangleright \varepsilon_{I'} & \downarrow id_{FGA} \triangleright F\eta_{I'} & \downarrow F(id_{GA} \otimes \eta_{I'}) \\
 & (1) & & & (5) \\
 & FGA \triangleright I' & \xrightarrow{(2)} & FGA \triangleright FI & \xrightarrow{m_{GA, I}} & F(GA \otimes I) \\
 & \downarrow \varepsilon_{FGA \triangleright id_{I'}} & \downarrow id_{FGA} \triangleright m_I & \downarrow F\rho_{GA} & \downarrow F\text{ex}_{GA, I} & (8) \\
 & (3) & & & & \\
 & A \leftarrow \xleftarrow{\varepsilon_A} & FGA & \xleftarrow{F\lambda_{GA}} & F(I \otimes GA) & \downarrow F(\eta_{I'} \otimes id_{GA}) \\
 & \downarrow \lambda'_A & \downarrow FG\lambda'_A & \downarrow FG\lambda'_A & \downarrow F(\eta_{I'} \otimes id_{GA}) & \\
 I' \triangleright A & \xleftarrow{\varepsilon_{I' \triangleright A}} & FG(I' \triangleright A) & \xleftarrow{F\eta_{I', A}} & F(GI' \otimes GA) & \\
 & (4) & & & &
 \end{array}$$

The second triangle in the proof commutes as follows: (1) and (5)–coalgebra; (2) and (4)– ε is

monoidal; (3)– C is symmetric.

$$\begin{array}{c}
 A \triangleright B \xrightarrow{h_A \triangleright h_B} FGA \triangleright FGB \xrightarrow{m_{GA,GB}} F(GA \otimes GB) \xrightarrow{F\epsilon_{A,B}} F(GB \otimes GA) \xrightarrow{F\eta_{B,A}} FG(B \triangleright A) \\
 \parallel \quad (1) \quad \quad \quad \parallel \quad (2) \quad \quad \quad \parallel \quad (3) \quad \quad \quad \parallel \quad (4) \quad \quad \quad \parallel \quad (5) \quad \quad \quad \parallel \\
 A \triangleright B \xleftarrow{\epsilon_{A \triangleright B}} FG(A \triangleright B) \xleftarrow{F\eta_{A,B}} F(GA \otimes GB) \xleftarrow{F\epsilon_{B,A}} F(GB \otimes GA) \xleftarrow{m_{GB,GA}} FGB \triangleright FGA \xleftarrow{h_A \triangleright h_A} B \triangleright A
 \end{array}$$

The third diagram commutes as follows, which uses Lemma ??.

$$\begin{array}{c}
 (A \triangleright B) \triangleright C \xrightarrow{\alpha'_{A,B,C}} A \triangleright (B \triangleright C) \xrightarrow{h_A \triangleright h_{B \triangleright C}} FGA \triangleright FG(B \triangleright C) \\
 \downarrow \epsilon_{(A \triangleright B) \triangleright C} \quad \quad \quad \downarrow \epsilon_{A \triangleright (B \triangleright C)} \\
 FG((A \triangleright B) \triangleright C) \quad \quad \quad A \triangleright (B \triangleright C) \\
 \uparrow F\eta_{A \triangleright B, C} \quad \quad \quad \uparrow FGA'_{A,B,C} \\
 F(G(A \triangleright B) \otimes GC) \quad \quad \quad FG(A \triangleright (B \triangleright C)) \\
 \uparrow F(\eta_{A,B} \otimes id_{GC}) \quad \quad \quad \uparrow F\epsilon_{A \triangleright (B \triangleright C)} \\
 F((GA \otimes GB) \otimes GC) \xrightarrow{F\alpha_{GA,GB,GC}} F(GA \otimes (GB \otimes GC)) \quad \quad \quad F\eta_{A,B \triangleright C} \\
 \downarrow F(\epsilon_{A,B} \otimes id_{GC}) \quad \quad \quad \downarrow F\epsilon_{GA,GB \otimes GC} \quad \quad \quad \downarrow F(id_{GA} \otimes \eta_{B,C}) \\
 F((GB \otimes GA) \otimes GC) \quad \quad \quad F((GB \otimes GC) \otimes GA) \quad \quad \quad F(GA \otimes G(B \triangleright C)) \\
 \downarrow F(\eta_{B,A} \otimes id_{GC}) \quad \quad \quad \downarrow F\alpha_{GB,GC,GA} \quad \quad \quad \downarrow F(\eta_{B,C} \otimes id_{GA}) \\
 F(G(B \triangleright A) \otimes GC) \quad \quad \quad F(GB \otimes (GC \otimes GA)) \quad \quad \quad F(G(B \triangleright C) \otimes GA) \\
 \downarrow F\alpha \quad \quad \quad \downarrow F(id_{GC} \otimes \epsilon_{C,A}) \quad \quad \quad \downarrow F(id_{GB} \otimes \eta_{C,A}) \\
 F(GB \otimes (GA \otimes GC)) \quad \quad \quad F(GB \otimes G(C \triangleright A)) \quad \quad \quad F(GB \otimes G(A \triangleright C)) \\
 \downarrow F(id_{GB} \otimes \eta_{A,C}) \quad \quad \quad \downarrow F\eta_{B,C \triangleright A} \\
 FG((B \triangleright A) \triangleright C) \quad \quad \quad FG(B \triangleright (C \triangleright A)) \quad \quad \quad FG(B \triangleright (A \triangleright C)) \\
 \downarrow \epsilon_{(B \triangleright A) \triangleright C} \quad \quad \quad \downarrow \epsilon_{B \triangleright (A \triangleright C)} \\
 (B \triangleright A) \triangleright C \quad \quad \quad B \triangleright (A \triangleright C) \\
 \downarrow \alpha'_{B,A,C} \quad \quad \quad \downarrow id_{B \triangleright A} \otimes \epsilon_{A,C}^S \\
 B \triangleright (A \triangleright C) \quad \quad \quad B \triangleright (C \triangleright A) \\
 \downarrow \alpha'_{B,C,A} \quad \quad \quad \downarrow \epsilon_{(B \triangleright C) \triangleright A} \\
 B \triangleright (C \triangleright A) \quad \quad \quad FG((B \triangleright C) \triangleright A)
 \end{array}$$
